

Matrix Transposition Exercise

This exercise involves creating an OpenCL application that takes as input a matrix (width \times height) and determines the transposition of the input matrix.

In the following example, the transposition of matrix A is obtained by swapping the writing of the rows in A with the columns of A^T :

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}^T = \begin{bmatrix} 1 & 4 & 7 \\ 2 & 5 & 8 \\ 3 & 6 & 9 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}^T = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$$
